1.Design a proxy contract Proxy, this proxy contract can call the external contract FuncWithSelector. All external contracts implement an external function, which is uniquely identified in the proxy contract. When a call is made to the Proxy, it is routed to the correct external contract using a function selector. There is an admin that can register external contracts in the proxy. When registering, the agent deploys it using its selector as the salt.

2. Complete the Multicall contract and implement a function multicall to call testMulticall and testMulticall1 in the external contract FuncWithSelector
